Report Overview

Centralized lubrication can deliver either grease or oil to a lubrication point. The basic operation of a centralized system includes the following: The system controller and injectors are preset to deliver a specific amount of lubricant at a specific interval. To deliver the lubricant, the lubricant pump is activated by the controller, via an air solenoid. This builds pressure in the lines, causing the grease to flow out of the injectors. A pressure switch is incorporated in the system to deactivate the pump once the lubricant injection is complete. In the last step of this process, the system directs any lubricant remaining in the lines back into the reservoir by venting.

The global Centralized Automatic Lubrication Systems market size was estimated at USD 1210.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
