Report Overview:

Centralized management system (big BMS mode): This management structure is to concentrate all units for collecting single voltage & voltage backup and temperature on one BMS board, and the vehicle controller directly controls the relay control box. Most low-voltage HEVs have such a structure, and typical applications of PHEVs and EVs are LEAF, Cmax, etc. The advantage of doing this is that it is relatively simple and the cost is low. Since the acquisition and backup are on the same board, the communication between them is also simplified. The disadvantages are of course obvious. The wire harness for single sampling is relatively long, which leads to a more complicated design of the sampling wire. The long and short wires cause additional voltage drop when equalizing; The highest channel that BMS can support is also limited. This method is low in cost, but its applicability is relatively poor, and its performance cannot be guaranteed in some places, so it can only be applied to smaller battery packs.

The Global Centralized Battery Management System Market Size was estimated at USD 483.95 million in 2023 and is projected to reach USD 588.03 million by 2029, exhibiting a CAGR of 3.30% during the forecast period.
