Abstracts

A centralized liquid-cooled energy storage system is a large-scale energy storage solution that uses liquid cooling technology to manage the temperature of battery packs. The system effectively absorbs and dissipates the heat generated by the battery during the charging and discharging process by circulating coolant, ensuring that the battery operates within the optimal temperature range, thereby improving battery efficiency, extending service life and enhancing system safety. The centralized design means that the cooling system serves the entire energy storage unit or a larger collection of battery modules, which can achieve more uniform temperature distribution and higher energy utilization efficiency compared to decentralized cooling methods. This system is widely used in large-scale energy storage projects, such as grid peak regulation, renewable energy integration, and backup power systems in industrial facilities.

The global Centralized Liquid Cooling Energy Storage System market size was estimated at USD 506.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
