Abstracts

A centralized power system refers to an electrical grid structure where electricity is generated at large-scale power plants, such as coal, nuclear, hydroelectric, or natural gas facilities, and then transmitted over long distances through high-voltage transmission lines to substations, where it is stepped down in voltage for distribution to end consumers across a wide geographic area. This model relies on a hierarchical, top-down flow of energy from a limited number of generation sources to many dispersed users, requiring extensive infrastructure for transmission and distribution, as well as centralized control and dispatch to maintain grid stability, balance supply and demand, and ensure reliability. While this system has historically dominated due to economies of scale and efficient management of baseload power, it faces challenges related to transmission losses, vulnerability to single points of failure, limited flexibility in integrating renewable energy sources, and environmental concerns associated with large fossil fuel-based generation.

The global Centralized Power System market size was estimated at USD 185000.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
