Report Overview

The centrifugal clutch and brake are composed of a transmission shaft with flying blocks around it. The flying block is fixed on the shaft by a spring, and there is a friction pad outside the flying block. In a centrifugal clutch, the hub is not fixed and will start to rotate when the engaging speed or operating speed is reached. In centrifugal brakes, the outer hub is fixed and cannot rotate. When the friction pad is connected to the hub, braking force will be generated. When designing and operating centrifugal brakes, special attention must be paid to braking time and maximum heat.
