In 2024, global centrifugal granulation and coating machine production reached approximately 470,000 units, with an average global market price of around US\$3,000 per unit. In 2024, the global 's total production capacity of centrifugal granulation and coating machine reached 620,000 units. The industry average gross profit margin of this product reached 26%. A Centrifugal Granulation and Coating Machine is a type of industrial processing equipment used to create granules from powder and apply uniform coating layers onto particles like powders, granules, or pellets. It operates by utilizing centrifugal force generated by a rotating disc, along with friction and airflow, to mix materials with sprayed binding or coating liquids. This process achieves functions including granulation, pellet formation, drug layering, and coating (e.g., film, enteric, or protective coatings). It is widely applied in industries requiring high precision, such as pharmaceuticals, food, and chemicals, for its efficiency and ability to produce high-quality, consistent products. The upstream supply chain consists of raw material and component suppliers, including those providing steel, plastics, motors, precision bearings, PLC control systems, and specialized nozzles. Midstream involves the manufacturers of the centrifugal granulation and coating machines, including international players like GEA and Romaco Group, as well as Chinese manufacturers such as Changzhou Jiafa and Shandong Xinma. These machines are then supplied downstream to end-user industries such as pharmaceuticals, food processing, and chemicals for their production lines.

The global Centrifugal Granulation and Coating Machine market size was estimated at
