Report Overview

A centrifugal juicer is a type of juicer that uses centrifugal force to extract juice from fruits and vegetables. It works by spinning a mesh filter at high speeds, which separates the juice from the pulp. The centrifugal force created by the spinning motion pushes the juice through the filter and into a separate container, while the pulp is collected in a separate compartment. Centrifugal juicers are known for their fast juicing process and are often more affordable compared to other types of juicers. However, they may not be as efficient in extracting juice from leafy greens and may produce more foam and oxidation in the juice due to the high-speed spinning.

The global Centrifugal Juicer market size was estimated at USD 343.70 million in 2023 and is projected to reach USD 515.19 million by 2032, exhibiting a CAGR of 4.60% during the forecast period.
