Abstracts

Ceramic catalyst carriers are specialized substrates, typically manufactured from materials such as cordierite, alumina, or silicon carbide, that serve as the foundational support structure for catalytic converters in automotive and industrial exhaust systems. These carriers are engineered with a honeycomb-like monolithic structure featuring numerous parallel channels coated with a washcoat containing precious metal catalysts, which facilitate chemical reactions to convert harmful pollutants such as nitrogen oxides (NO_x), carbon monoxide (CO), and hydrocarbons (HC) into less toxic substances like nitrogen, carbon dioxide, and water vapor. Their design prioritizes high surface area, thermal stability, mechanical strength, and low thermal expansion to withstand extreme operating conditions, including rapid temperature fluctuations and exposure to corrosive gases, while optimizing catalytic efficiency and minimizing backpressure in exhaust systems.

The global Ceramic Catalyst Carriers market size was estimated at USD 1200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
