## Abstracts

Ceramic femoral heads are precision-engineered medical implants used in total hip arthroplasty (THA), serving as the ball component of a hip prosthesis that articulates within the acetabular cup to restore joint function. Typically manufactured from high-purity alumina or zirconia-toughened alumina (ZTA) ceramics, these components are valued for their exceptional hardness, wear resistance, biocompatibility, and low friction properties, which contribute to reduced polyethylene wear debris and lower risk of osteolysis compared to metal alternatives. Designed to attach to a femoral stem via a tapered connection, ceramic femoral heads are available in various sizes and neck lengths to accommodate patient anatomy and surgical requirements, and they are often utilized in younger, more active patients due to their longevity and performance advantages in minimizing long-term revision rates.

The global Ceramic Femoral Heads market size was estimated at USD 528.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
