## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Ceramic GOS Scintillator competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Ceramic GOS scintillator is a material with excellent scintillation properties. Its main component is  $Gd_2O_3$ . It is widely used in radiation detection, nuclear medical imaging and industrial detection. Its main luminescence peak is at 512 nm, and it has excellent properties such as high light output, high density (7.34 g/cm<sup>3</sup>), and short afterglow (less than 0.1% and 3 ms). GOS ceramics are translucent, moisture-resistant, non-toxic and easy to process. Different dopants have different luminescence properties. GOS ceramics belong to the hexagonal crystal system, are anisotropic, and exhibit birefringence at the grain boundaries, which makes the preparation of transparent ceramics more difficult. Its high light output and high density characteristics make it of great value in applications such as X-ray detectors, foreign body detectors, and radiation detection.

The global Ceramic GOS Scintillator market size was estimated at USD 473.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
