Abstracts

Ceramic blade is a new type of blade made of high-tech nanotechnology, which has the characteristics of high hardness, high density, high temperature resistance, anti-magnetization, and anti-oxidation. Most of the ceramic blades are processed with a nano-material "zirconia", which is developed by high-pressure precision ceramics. Its sharpness is more than ten times that of steel knives, and it has advantages that traditional metal knives cannot match. The ceramic blade has the characteristics of high hardness, high density, high temperature resistance, anti-magnetization, and anti-oxidation, which make it perform well in the process of cutting, peeling, and vegetable cutting, and is not easy to wear, deform, and oxidize, and can be kept for a long time sharpness. Technological innovation: Continuous innovation in lathe ceramic cutting tool manufacturing technology will help improve product quality and production efficiency, reduce production costs, and meet customer demand for high-quality ceramic cutting tools. For example, the use of new ceramic materials and manufacturing processes can make ceramic tools more wear-resistant, high-temperature resistant, and corrosion-resistant, and improve the service life and processing efficiency of the tools. Diversified application fields: Currently, lathe ceramic cutting tools are mainly used in high-precision, high-speed machining fields, such as automobile manufacturing, aerospace, energy and other fields. In the future, with the continuous development of ceramic technology, ceramic cutting tools will be used in more fields of mechanical processing, such as superhard materials, high-strength metals and other fields.

The global Ceramic Inserts market size was estimated at USD 585.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
