Abstracts

A ceramic metal feedthrough is a specialized hermetic sealing component designed to enable the passage of electrical signals, power, or fluids between isolated environments?such as between a vacuum chamber and the external atmosphere?while maintaining pressure integrity, electrical insulation, and resistance to extreme temperatures or corrosive conditions. It typically consists of a metal conductor (or multiple conductors) embedded within a ceramic insulator, which is brazed or bonded to a metal flange or housing, creating a robust, leak-tight assembly capable of withstanding high mechanical stress, thermal cycling, and harsh operational environments. These components are critical in applications requiring reliable performance under demanding conditions, such as in high-vacuum systems, aerospace, medical implants, semiconductor manufacturing, and energy transmission equipment.

The global Ceramic Metal Feedthrough market size was estimated at USD 250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
