Abstracts

The ceramic encapsulated uncooled infrared detector is a device that uses vanadium oxide microbolometer technology to convert infrared radiation into electrical signals. It does not require refrigeration devices to reduce the operating temperature, so it has the advantages of low power consumption, small size, and no TEC. It can be used in low-power, size-sensitive applications, such as security monitoring, medical diagnosis, industrial testing, etc. The main parameters of ceramic package uncooled infrared detectors include resolution, pixel size, response spectrum, sensitivity (NETD), frame rate, power consumption, etc. Different parameters correspond to different performance and application requirements. For example, the higher the resolution, the clearer the imaging effect, but the power consumption will also increase; the smaller the pixel size, the smaller the size of the detector, but the sensitivity will also decrease; different response spectrum segments correspond to different temperature ranges and targets. Type etc.

The global Ceramic Package Uncooled Infrared Detector market size was estimated at USD 480.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.45% during the forecast period.
