Abstracts

Ceramic PTC resettable fuses are thermally sensitive, current-limiting overcurrent protection devices made from conductive polymer-ceramic composites that exhibit a positive temperature coefficient (PTC) effect, meaning their electrical resistance increases sharply and non-linearly when exposed to excessive current or temperature, thereby limiting fault current to a safe level; unlike traditional one-time fuses, they automatically reset to a low-resistance state once the fault is removed and the device cools, offering reusable circuit protection without requiring replacement, which makes them ideal for applications where maintenance access is difficult or frequent overcurrent events are expected, such as in automotive electronics, power supplies, battery packs, and consumer appliances.

The global Ceramic Ptc Resettable Fuses market size was estimated at USD 735.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
