This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Ceramic PTC Thermister competitive dynamics, regional economic interdependencies, and supply chain reconfigurations.

CPTC Ceramic Positive Temperature Coefficient Thermistor (ceramic positive temperature coefficient thermistor) is a kind of thermistor designed with semiconductor ceramic materials. The main material is barium carbonate, and a small amount of rare earth, recipient elements and additives such as glass are added. Semiconductor resistors with temperature sensitivity are formed through high-temperature sintering. It has a small resistance below the Curie temperature. When the temperature exceeds the Curie temperature, the resistance value increases step by step with the rise in temperature. It is used for overheat sensing in circuits and plays a role in overheat and overcurrent protection. The market size continues to expand. With the rapid development of industries such as electronics, communications, automobiles, and home appliances, the demand for ceramic PTC thermistors is constantly increasing. Especially in emerging fields such as new energy vehicles, 5G communications, and the Internet of Things, the application prospects of ceramic PTC thermistors are broad.
