Report Overview

Ceramic is an inorganic, non-metallic, often crystalline oxide, nitride or carbide material. It is brittle, hard, strong in compression, and weak in shearing and tension. It can withstand chemical erosion that occurs in other materials subjected to acidic or caustic environments. Ceramics generally can withstand very high temperatures, ranging from 1,000 °C to 1,600 °C (1,800 °F to 3,000 °F).

Screws are often self-threading (also known as self-tapping) where the thread cuts into the material when the screw is turned, creating an internal thread that helps pull fastened materials together and prevent pull-out.
