Abstracts

Ceramic separation membrane is a membrane made of powder materials such as aluminum oxide, zirconium oxide, and titanium oxide through sintering process. The wall of ceramic separation membrane is densely covered with micropores. The static pressure difference on both sides of the membrane is used as the driving force during filtration. Small molecules (or liquids) pass through the membrane, and large molecules (or solid particles, liquid droplets) are intercepted by the membrane, thereby achieving the purpose of separation, concentration and purification of different components of the feed liquid.

The global Ceramic Separation Membrane market size was estimated at USD 416.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.60% during the forecast period.
