Report Overview:

Ceramic submount refers to using the production process of sputtering, deposition, sputtering, etc. , to coat a layer of film on the ceramic substrate material, which is used to improve the heat dissipation performance of the device, especially in the high-power optoelectronic device that produces more heat. The ceramic substrate materials mainly include aluminum oxide, aluminum nitride, beryllium oxide, silicon carbide, boron nitride, silicon nitride, etc. In view of the current market comprehensive price and product performance, alumina and aluminum nitride are the two most common substrates. Although the price of aluminum nitride is about 4 times that of alumina, due to its high thermal conductivity and the better heat dissipation performance, the aluminum nitride is currently the most commonly used substrate, followed by alumina.

The Global Ceramic Submount Market Size was estimated at USD 382.68 million in 2023 and is projected to reach USD 438.62 million by 2029, exhibiting a CAGR of 2.30% during the forecast period.
