Abstracts

Ceramic wear lining is an accessory made of high - hardness ceramic materials to protect the easily - worn parts of equipment. It's crafted from raw materials like alumina and silicon carbide through processes such as molding and sintering. With a Mohs hardness of around 9, much higher than metals, it's installed on the inner walls of equipment, like coal - conveying pipelines in power plants or chutes in cement plants, either by adhesive bonding or bolt fastening. It can effectively resist wear against high - speed material scouring and strong friction, reducing equipment wear, extending service life, and ensuring efficient and stable industrial production.

The global Ceramic Wear Lining market size was estimated at USD 412.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
