Abstracts

Ceramicized polyolefin is a specialized polymer composite material that incorporates ceramic fillers, such as alumina, silica, or boron nitride, into a polyolefin matrix—typically polyethylene or polypropylene—to enhance thermal, mechanical, and electrical properties. This modification transforms standard polyolefins, which are known for their chemical resistance, flexibility, and cost-effectiveness but limited thermal stability, into materials capable of withstanding higher temperatures, improving flame retardancy, and offering better dielectric strength. The ceramic particles act as reinforcing agents that not only increase heat deflection temperatures and reduce flammability by forming protective ceramic char layers but also improve dimensional stability and mechanical strength. As a result, ceramicized polyolefins bridge the gap between conventional plastics and high-performance engineering polymers, making them suitable for demanding applications where thermal management, safety, and durability are critical.

The global Ceramicized Polyolefin market size was estimated at USD 420.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
