Abstracts

Ceramic matrix composites (CMCs) are advanced materials composed of ceramic fibers embedded in a ceramic matrix, combining the high-temperature resistance, hardness, and chemical stability of monolithic ceramics with improved fracture toughness and mechanical reliability due to the fiber reinforcement. These materials are designed to overcome the inherent brittleness of traditional ceramics, making them suitable for extreme environments where metals and polymers would fail, such as in aerospace propulsion, energy generation, braking systems, and nuclear applications. CMCs are typically classified by their matrix composition?such as oxide/oxide, carbon/carbon, or silicon carbide/silicon carbide?and by the manufacturing processes used, including chemical vapor infiltration, polymer infiltration and pyrolysis, or melt infiltration, each tailored to achieve specific performance characteristics like thermal stability, oxidation resistance, and mechanical strength under load.

The global Ceramicmatrix Composite market size was estimated at USD 725.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.45% during the forecast period.
