Report Overview

Cereal Processing, treatment of cereals and other plants to prepare their starch for human food, animal feed, or industrial use. Cereals, or grains, are members of the grass family cultivated primarily for their starchy seeds (technically, dry fruits). Wheat, rice, corn (maize), rye, oats, barley, sorghum, and some of the millets are common cereals; Cereal processing is a complicated process. The main procedure is milling, which is grinding grain so it can be easily cooked and rendered into an appealing food. Cereals are usually not eaten raw, but different types of milling (dry and wet) are used depending on the cereal and the consumer's eating habits. Wheat can be crushed using grinding stones or similar devices, or by modern automated systems that use steel cylinders, followed by air purification and numerous sievings to separate the endosperm from the outer coverings and germ.

The global Cereal Processing market size was estimated at USD 59800 million in 2023 and is projected to reach USD 88106.04 million by 2032, exhibiting a CAGR of 4.40% during the forecast period.
