Report Overview:

Transcatheter aortic valve implantation (TAVI), also known as TAVR or Transcatheter aortic valve replacement is used in the treatment of aortic stenosis (AS). Transcatheter aortic valve implantation is the therapy of choice for patients with severe aortic stenosis who have prohibitive or high surgical risk. However, the benefit of TAVI is attenuated by the occurrence of major disabling stroke which is associated with increased mortality and early-reduced quality of life. Despite advances in TAVI technology, stroke remains a serious complication that is associated with significant negative outcomes. The majority of these occur in the acute phase following TAVI where cerebral embolic events are frequent. Cerebral embolic protection devices (CEPD) have been developed to minimize the risk of peri-procedural ischemic stroke during TAVI.

The Global Cerebral Embolic Protection Devices for TAVI Market Size was estimated at USD 64.84 million in 2023 and is projected to reach USD 258.24 million by 2029, exhibiting a CAGR of 25.90% during the forecast period.
