Abstracts

Compared with intra-aneurysmal flow disruptors, FDs have wider range of utility across aneurysms types, including ruptured, posterior circulation, nonsaccular, blister, anterior communicating, and pericallosal arteries, as well as utility in treating dissections and direct carotid-cavernous fistulas. For flow disruptors such as WEB, the range of aneurysms appropriate for treatment is narrower. The primary mechanism of efficacy for WEB is endosaccular disruption, which induces thrombogenesis within the dome and secondary flow diversion and neoendothelialization at the neck. Aneurysms for WEB should be wide-necked bifurcation aneurysms with a straight angle of approach for intrasaccular catheter placement. WEB cannot be successfully deployed in side wall aneurysms.
