Abstracts

Cerebral folate deficiency (CFD) refers to a neurological syndrome characterized by low levels of the active folate metabolite 5-methyltetrahydrofolate (5-MTHF) in the cerebrospinal fluid, despite normal folate levels in the blood. This condition results from impaired folate transport across the blood-brain barrier, often due to autoantibodies targeting the folate receptor alpha (FR?) or genetic mutations affecting folate metabolism pathways. CFD presents with a range of neurological symptoms, including developmental regression, movement disorders, seizures, and autism spectrum features, typically emerging in infancy or early childhood. Diagnosis relies on specialized testing, including measurement of 5-MTHF in cerebrospinal fluid and detection of FR? autoantibodies, while treatment primarily involves high-dose folinic acid (leucovorin) supplementation to bypass the transport defect and restore cerebral folate levels.

The global Cerebral Folate Deficiency market size was estimated at USD 150.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
