Report Overview

Placement of cerebral spinal fluid (CSF) shunt systems to treat hydrocephalus is a common medical procedure and a life-saving treatment for many patients. These shunt systems drain excess fluid from the brain to another part of the body where the fluid is absorbed as part of the circulatory process. CSF shunts contain three main components: an in-flow tube (catheter), a valve that regulates the flow of fluid, and an outflow catheter that carries the fluid to the abdomen or the heart where the fluid can be absorbed.
