Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Ceria for Semiconductor competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Ceria for Semiconductor production reached approximately 50,000 tons, with an average global market price of around US\$ 2,000 per ton. Ceria for Semiconductor refers to ultra-high-purity cerium oxide (CeO₂) engineered specifically for two critical applications in advanced semiconductor manufacturing: Chemical Mechanical Planarization (CMP) and functional thin film deposition. Both applications demand ultra-high purity ceria with precisely controlled properties, but the specific requirements differ significantly based on the application. While CMP ceria focuses on particle size distribution and surface reactivity, thin film ceria emphasizes crystal structure perfection and interface engineering. The development of advanced deposition techniques (such as ALD and PLD) has enabled the precise application of ceria as functional thin films, complementing its traditional role in CMP processes. Together, these two application areas make ceria an indispensable material for next-generation semiconductor manufacturing, supporting the continued scaling of integrated circuits and the development of novel semiconductor devices. The downstream products mainly include CMP polishing liquid manufacturers, including Entegris, Resonac, and Fujimi Incorporated.

The global Ceria for Semiconductor market size was estimated at USD 100.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.10% during the forecast period.
