Abstracts

Ceria polishing slurry is a specialized chemical-mechanical planarization (CMP) material composed of cerium oxide (CeO_2) nanoparticles suspended in a liquid medium, which is widely utilized in the semiconductor, optics, and precision manufacturing industries for high-precision surface finishing. Its primary function is to enable ultra-smooth, defect-free planarization of surfaces through both chemical etching and mechanical abrasion mechanisms, with key applications including silicon wafer polishing in integrated circuit fabrication, glass polishing for displays and lenses, and finishing of hard substrates such as sapphire and compound semiconductors. The effectiveness of ceria slurry stems from the unique physicochemical properties of cerium oxide, which exhibits high selectivity, removal rates, and surface quality, particularly on silicon dioxide (SiO_2) layers, making it indispensable in advanced technology nodes where nanoscale precision and minimal surface damage are critical.

The global Ceria Polishing Slurry market size was estimated at USD 620.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
