## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Cerium Oxide Based Polishing Powder competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Cerium Oxide Based Polishing Powder production reached approximately 7,672.7 tons, with an average global market price of around US\$ 16.5 per kilogram. Cerium Oxide Based Polishing Powder (also known as ceria polishing powder) is a high-precision abrasive material with cerium oxide ( $\text{CeO}_2$ ) as the core component, supplemented by lanthanum oxide, neodymium oxide, and other rare earth oxides. It is prepared through processes such as rare earth ore smelting, chemical purification, and ultrafine grinding, featuring controlled particle size distribution ( $0.1\text{--}5\text{ }\mu\text{m}$ ) and high hardness. With strong chemical-mechanical polishing (CMP) performance, it achieves ultra-smooth and scratch-free surfaces by combining mechanical abrasion and chemical reaction with the polished substrate. Widely used in polishing of semiconductor wafers, optical glass, liquid crystal displays (LCD), and precision ceramics, it is a key material for improving the surface quality of high-end electronic and optical products. The single-line production capacity of Cerium Oxide Based Polishing Powder is 352 to 355 tons per year, the average gross profit margin was 36.8%. The cost structure of Cerium Oxide Based Polishing Powder is dominated by four core components with clear weights: raw material costs account for the largest share at 50%-60%, mainly rare earth ores (such as bastnaesite, monazite) and rare earth oxides, where fluctuations in rare earth market prices directly drive overall cost volatility. Production and processing costs make up 20%-25%, covering ore beneficiation, acid leaching purification, precipitation crystallization, calcination, and ultrafine grinding?strict control over particle size uniformity and purity ( $\text{CeO}_2$  content  $\geq 90\%$  for high-end products) increases manufacturing complexity. R&D costs represent

10%-15%, dedicated to optimizing particle size distribution (improving polishing efficiency), enhancing dispersion stability, and developing customized formulas for semiconductor and optical applications, as product performance directly correlates with technological input. Packaging and logistics costs constitute the remaining 5%-8%, including moisture-proof packaging (for powder anti-caking) and bulk transportation, with storage requiring sealed conditions to avoid oxidation or moisture absorption. The industry chain of Cerium Oxide Based Polishing Powder consists of three interconnected tiers: upstream includes suppliers of rare earth ores, rare earth oxide intermediates, and production equipment (ultrafine grinders, particle size analyzers), as well as providers of chemical reagents (acids, precipitants) for purification processes. Midstream involves enterprises engaged in raw material processing, chemical purification, calcination, grinding, and product testing, focusing on adjusting process parameters and particle size specifications to meet the polishing requirements of different substrates (semiconductor wafers, optical glass). Downstream covers semiconductor manufacturers (wafer polishing), optical device producers (lens, display panel manufacturing), precision ceramic processing enterprises, and electronic component assemblers, with demand driven by the production of high-precision electronic and optical products. Demand for Cerium Oxide Based Polishing Powder is growing steadily driven by the expansion of global semiconductor manufacturing (especially 3C and advanced wafer processes), the upgrading of display technologies (LCD, OLED), and the development of precision optical and ceramic industries. It addresses pain points such as low polishing efficiency and surface scratches of traditional abrasives, while the trend of miniaturization and high precision of electronic products further boosts demand for high-purity, ultra-fine ceria polishing powder. Key business opportunities lie in developing high-CeO<sub>2</sub>-content products (>95%) for semiconductor advanced processes, optimizing particle size control to improve polishing uniformity, and expanding into emerging markets with growing electronic manufacturing (e.g., Southeast Asia, India). Additionally, leveraging circular economy models (recycling rare earths from polishing waste) to reduce raw material costs and meet environmental policies can further enhance competitiveness in the mid-to-high-end market.

The global Cerium Oxide Based Polishing Powder market size was estimated at USD 127.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
