Abstracts

A cerium sputtering target is a high-purity, solid-state material?typically in disc or rectangular form?composed primarily of the rare earth element cerium, often with trace additives to enhance performance characteristics such as grain structure, density, or thermal stability. It is utilized in physical vapor deposition (PVD) processes, particularly magnetron sputtering, where it is bombarded with ions in a vacuum chamber, causing cerium atoms to be ejected and deposited as a thin film onto substrates. These cerium-based coatings are valued for their optical, electronic, and protective properties, finding application in anti-reflective and protective layers for glass, optical components, semiconductors, and decorative finishes, where precise control over film composition and uniformity is critical.

The global Cerium Sputtering Target market size was estimated at USD 95.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
