Abstracts

The cervical cytology brush is a medical device specifically designed for collecting cell samples from the cervix during gynecological examinations, primarily for cervical cancer screening through tests like the Pap smear or HPV testing. It typically features a central bristle tip surrounded by flexible outer bristles or a plastic spatula-like extension, allowing for optimal collection of both endocervical and ectocervical cells to ensure a representative sample. The brush is engineered for single-use to prevent cross-contamination and is made from medical-grade materials that are safe for patient contact while effectively dislodging and retaining cellular material for laboratory analysis. Its design aims to maximize cell yield and diagnostic accuracy while minimizing patient discomfort, making it an essential tool in preventive women's healthcare.
