Abstracts

Cervical traction devices are medical apparatuses designed to gently stretch the neck, alleviating pressure on the cervical spine and associated nerves by creating controlled separation between the vertebrae. These devices function through either manual or mechanical means, employing weights, pulleys, pneumatic systems, or inflatable mechanisms to apply therapeutic force along the axis of the spine. They are used in both clinical settings, such as physical therapy offices and hospitals, and at-home environments to manage conditions like cervical radiculopathy, herniated discs, degenerative disc disease, whiplash injuries, and chronic neck pain. By decompressing spinal structures, these devices aim to reduce pain, improve mobility, and facilitate healing, often as part of a broader non-surgical treatment plan.

The global Cervical Traction Devices market size was estimated at USD 485.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
