Report Overview

Cervical vertebra lumbar vertebra retractor is a surgical instrument used to fix soft tissue and muscles during spinal surgery to expose the cervical vertebra or lumbar vertebra. The retractor is designed to provide access to the surgical area and protect nerves and other fine structures during surgery. A retractor typically consists of two curved blades that are gently inserted between soft tissue and muscle to separate and secure them, providing a clear view of the surgical area. The blade is then locked in place, allowing the surgeon to work without hindrance.
