Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on CFRP Aerostructures competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. CFRP aerostructures are primary or secondary load-bearing parts of an aircraft airframe made from carbon-fiber-reinforced plastic laminates or sandwich constructions. Typical products include wing covers and spars, fuselage barrels and panels, tailplanes and fin boxes, floor beams and interior floor panels, nacelles and engine fan cases, and rotorcraft blades. Modern long-range aircraft use CFRP extensively in wings and fuselage to cut structural weight, reduce part count and enable more aerodynamic shapes. Upstream, CFRP aerostructures are based predominantly on high-strength or intermediate-modulus carbon fibers, combined with aerospace-qualified epoxy, toughened epoxy, BMI, cyanate ester or high-temperature thermoplastic matrices such as PEEK, PEKK and PPS. Downstream, aerostructure manufacturers integrate these materials into large CFRP assemblies?wings, fuselage sections, empennage, nacelles and primary doors?which are then delivered to OEMs for final airframe integration and certification on commercial, regional, business and military aircraft. In 2024, global sales of CFRP aerostructures reached approximately 23 K tons, with an average global market price of around US\$ 269/kg. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 30% to 40%.

The global CFRP Aerostructures market size was estimated at USD 6137.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.20% during the forecast period.
