Abstracts

Amine-reactive dye CFSE (carboxyfluorescein diacetate, succinimidyl ester, also known as CFDA-SE) is widely used in cell proliferation and in vivo cell tracking. CFSE is non-fluorescent until it enters viable cells, where it is hydrolyzed by cytoplasmic esterase enzymes to release fluorescent amine-reactive dyes. These dyes then covalently react with the amine groups on intracellular proteins to form fluorescent conjugates that are retained in the cells. Moreover, due to this stable linkage, once the dyes are incorporated into the cells, they do not transfer to adjacent cells. CFSE was originally developed to track lymphocyte migration. Subsequent studies revealed that this dye can be used to monitor cell proliferation both in vitro and in vivo, as CFSE fluorescence in progeny cells was gradually halved as the cells division.

The global CFSE Cell Proliferation Kit market size was estimated at USD 295.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
