Report Overview

Chain transfer agents (CTAs) are molecules that are added to a polymerization reaction in order to control the length and molecular weight of the resulting polymer chains. CTAs act by terminating the growth of polymer chains and transferring the growing radical to a small molecule, which then becomes a new radical initiator. This results in the formation of a shorter polymer chain and limits the molecular weight distribution of the final polymer.

The global Chain Transfer Agent In Polymerization market size was estimated at USD 320.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.25% during the forecast period.
