Abstracts

Chalcogenide materials are a class of inorganic compounds primarily composed of one or more chalcogen elements (sulfur, selenium, or tellurium) combined with electropositive elements such as germanium, arsenic, antimony, or gallium, exhibiting unique optical, electrical, and thermal properties including high infrared transparency, phase-change behavior, and photosensitivity. These materials are critical in applications such as infrared optics for thermal imaging, optical data storage (e.g., CDs, DVDs), phase-change memory devices, photovoltaics, and chemical sensing due to their ability to switch between amorphous and crystalline states under thermal or optical stimulation. Their versatility also extends to emerging fields like integrated photonics and neuromorphic computing, underscoring their role as enabling materials in both established and next-generation technologies.

The global Chalcogenide Materials market size was estimated at USD 1545.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
