Abstracts

A changeover reed switch has three contact leads. Form C or double throw switch described the switching function as break-before-make. The switching sequence is as follows. One contact opens its connection to another contact and then closes its connection to a third contact. Furthermore contact configuration is the number of switches or poles used in a component. So a single pole double throw (SPDT) device contains a single changeover switch. Likewise double pole double throw (DPDT) contains to 2 changeover switches in a component. Finally changeover reed switches can also be used in a normally closed or Form B contact configuration. Changeover Reed Switch is a special type of reed switch, also known as single pole double throw (SPDT) reed switch. It has a contact that can be switched between two different positions, so it can switch between different circuit states. This switch is suitable for applications that require switching between two circuits, such as circuit selection, switching and control. Changeover reed switches open or close a circuit by bending the reed, similar to traditional reed switches. But unlike a normally closed (NC) or normally open (NO) reed switch, a changeover switch has an extra contact that can be toggled between two different positions, thereby changing the state of the circuit. Changeover reed switches are widely used in applications that require switching between different circuits, such as signal selection, circuit switching, control devices, etc.

The global Changeover Reed Switch market size was estimated at USD 119.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
