Abstracts

A charge adapter is an electronic device used to process and regulate charge signals. The main function of a charge adapter is to convert charge signals into voltage signals for subsequent measurement, analysis and processing. It is often used to convert weak charge signals output by piezoelectric sensors (such as accelerometers, pressure sensors, etc.) into voltage signals that are easy to measure. In addition, the charge adapter can also amplify, filter and adjust the signal to improve the signal-to-noise ratio and measurement accuracy of the signal. The working principle of the charge adapter is based on the principle of charge conservation and the effect of the electric field. When the piezoelectric sensor is subjected to external force, charges are generated inside it. These charges enter the internal circuit through the input end of the charge adapter, and after amplification and conversion, the output is a voltage signal. The internal circuit usually includes a high-impedance feedback resistor to convert the charge into voltage and maintain a stable output.

The global Charge Adapter market size was estimated at USD 213.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
