Abstracts

The chassis-by-wire system represents an advanced automotive control architecture where traditional mechanical linkages between driver inputs and vehicle components are replaced by electronic and electro-mechanical systems, enabling drive-by-wire, steer-by-wire, and brake-by-wire functionalities. This technology eliminates physical connections such as steering columns, hydraulic brake lines, and mechanical throttle linkages, instead utilizing sensors to capture driver inputs, electronic control units (ECUs) to process commands, and actuators to execute operations like steering, braking, and acceleration. By integrating these systems digitally, chassis-by-wire enhances vehicle design flexibility, reduces weight, improves safety through redundancy and stability control integration, and supports advanced driver-assistance systems (ADAS) and autonomous driving capabilities. The shift toward electrification and software-defined vehicles further accelerates adoption, as chassis-by-wire systems enable tighter integration with electric powertrains and over-the-air updates for dynamic performance tuning.

The global Chassis By Wire System market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
