Abstracts

Chelated nutritional iron compounds are primarily used to provide iron to plants. They are commonly available as yellow powder, which is first dissolved in water to create a concentrated stock solution. This solution is then diluted to the required concentration and applied as a fertilizer to nourish plants. Iron is crucial for chlorophyll production in plants, which is necessary for photosynthesis and energy production. When plants lack iron, their ability to produce energy is significantly hindered, leading to stunted growth. To address iron deficiency, chelated iron compounds, such as EDTA-Fe (iron chelated with EDTA), are used. These compounds enhance iron absorption in plants, ensuring they receive the necessary nutrients for healthy growth.

The global Chelated Nutritional Iron Compound market size was estimated at USD 712.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
