### Report Overview

Chemical Mechanical Planarization (CMP) is a polishing process used to manufacture wafers for the semiconductor industry. It requires the use of a polishing tool and polishing slurry. The slurry in the tool is delivered to the wafer surface and may contain large particles/agglomerates (> 1  $\mu$ m) as a result of shipping/handling issues, drying, and interactions within the slurry distribution systems. These large particles can, in turn, increase the level of defectives (scratches) on the semiconductor wafer surface found after the CMP process has been completed. One of the solutions for decreasing the level of defects caused by large slurry particles is through the use of slurry filtration. For these applications, 0.5 to 5 micron filters are typically used.

CMP Slurry Filters are designed to maximize many different semiconductor processes performance by controlling the size, and concentration of slurry particles. Cutting edge CMP filtration technologies lead to higher yields and less defects. By implementing industry leading filter designs, slurry particle size, and quantity of Large Particle Counts (LPCs) can be controlled to specified process parameters.
