Abstracts

Chemical Mechanical Polishing (CMP) consumables are critical materials used in semiconductor manufacturing to achieve wafer surface planarization. They include CMP slurry, polishing pads, and pad conditioners, which work through a combination of chemical reactions and mechanical abrasion to remove excess material and ensure precise layer stacking for advanced device architectures. Different CMP consumables are tailored to specific applications, such as metal layer polishing (copper, tungsten), dielectric layer planarization (SiO₂, low-k), and the fabrication of advanced logic and memory devices. The global CMP consumables market is highly concentrated, dominated by a few multinational players with strong technological barriers and stringent customer qualification processes. Looking forward, the CMP consumables industry is expected to see steady growth, driven by demand from advanced process nodes (5nm and below), new requirements from 3D NAND and advanced packaging, and semiconductor capacity expansion fueled by artificial intelligence, high-performance computing, and electric vehicles. Key R&D trends include environmentally friendly and low-defect slurries, longer-lifetime polishing pads, and intelligent monitoring solutions for consumable usage. As semiconductor manufacturing evolves toward more complex architectures, both the market scale and technical sophistication of CMP consumables will increase, with the competitive landscape moving toward a balance between global leaders and emerging local suppliers.

The global Chemical Mechanical Polishing (CMP) Consumables market size was estimated at USD 3701.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
