Abstracts

Chemical polishing fluid is a specialized chemical solution used in surface finishing processes to enhance the smoothness, reflectivity, and overall quality of metal surfaces through controlled chemical etching and leveling, typically applied to materials like stainless steel, aluminum, and copper alloys in industries such as automotive, aerospace, electronics, and decorative hardware manufacturing. These fluids function by selectively dissolving microscopic peaks on a material's surface, resulting in a uniform, glossy finish without the need for mechanical abrasion, and they are often formulated with acids, oxidizers, inhibitors, and surfactants tailored to specific metal types and desired outcomes, balancing efficiency, environmental regulations, and cost-effectiveness.

The global Chemical Polishing Fluid market size was estimated at USD 485.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
