Abstracts

Separation membranes are very thin fibers produced out of polymers, cross-linked to give rise to nano-sized pores, and are used to filter out unwanted particles from the useful ones. Chemical separation includes only those membranes which are used to separate two or more different types of gases or liquids. These are available in various types, depending on the functionality and the raw material used to manufacture them. The development of better quality membranes that give companies a competitive edge over other membranes in the market is the key focus of manufacturers. For example, in the gas contacting application, manufacturers are met with the issue of concentration polarization, which impedes the bubble-free contacting of gas in a liquid medium. Moreover, the operation of mechanical mixing devices is often expensive and energy consuming. Mechanical mixers are sometimes not feasible in small-scale applications, which calls for the need for a better technology to address these issues.

The global Chemical Separation Membranes market size was estimated at USD 1720.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
