Abstracts

Chemically-strengthened Glass is glass that has been treated with a chemical process after it was manufactured to render it stronger. The chemical process is called an ion-exchange reaction. During this process, glass is submerged in a bath of potassium salt or potassium nitrate at 300 degrees Celsius. The bath isn't hot enough to melt the glass, but the relatively high temperature allows the potassium nitrate to react with the surface of the glass, causing ions to be exchanged and compacted, thereby strengthening the glass.

The global Chemically Strengthened And Sapphire Glass market size was estimated at USD 1796.05 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 2.80% during the forecast period.
