Report Overview

Chemotherapy-Induced Nausea and Vomiting (CINV) drugs are a class of pharmaceutical agents specifically designed to prevent and manage the nausea and vomiting that often accompany cancer chemotherapy treatments. These medications work by targeting various receptors in the brain and gastrointestinal tract, thereby reducing the severity and frequency of emesis. CINV drugs can be categorized into several types, including serotonin antagonists, corticosteroids, neurokinin-1 receptor antagonists, and benzodiazepines. They are typically administered before, during, or after chemotherapy sessions to minimize the patient's discomfort and maintain their quality of life. The choice of CINV drugs and their dosages are often tailored to the individual patient's needs, taking into account factors such as the type of chemotherapy, the patient's medical history, and the potential side effects of the drugs.
