Report Overview

Chemotherapy-induced nausea and vomiting (CINV) is a common side-effect of many cancer treatments. Nausea and vomiting are two of the most feared cancer treatment-related side effects for cancer patients and their families. In 1983, Coates et al. found that patients receiving chemotherapy ranked nausea and vomiting as the first and second most severe side effects, respectively. Up to 20% of patients receiving highly emetogenic agents in this era postponed, or even refused, potentially curative treatments. Since the 1990s, several novel classes of antiemetics have been developed and commercialized, becoming a nearly universal standard in chemotherapy regimens, and helping to better manage these symptoms in a large portion of patients. Efficient mediation of these unpleasant and sometimes crippling symptoms results in increased quality of life for the patient, and better overall health of the patient, and, due to better patient tolerance, more effective treatment cycles.

Affecting 70-80% of patients undergoing chemotherapy, chemotherapy-induced nausea and vomiting (CINV) is one of chemotherapy's most debilitating side effects, often attributed as a leading cause of premature discontinuation of cancer treatment.

Global Chemotherapy Induced Nausea and Vomiting (CINV) Drugs key players include Haisco, Merck, Mundipharma, Qilu Pharma, Heron Therapeutics, Teva, etc.

Global top six manufacturers hold a share about 30%.

North America is the largest market, with a share about 35%, followed by Europe and Asia-Pacific, both have a share about 60 percent.

In terms of product, 5-HT3 Inhibitors is the largest segment, with a share over 70%. And in terms of application, the largest application is Acute CINV, followed by Delayed CINV and Breakthrough CINV.
