## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Chest Electrical Impedance Tomography Device competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Chest Electrical Impedance Tomography Device production reached approximately 5,528 units, with an average global market price of around US\$ 89,000 per unit. In 2024, the global 's total production capacity of Chest Electrical Impedance Tomography Device reached 7,300 units. The industry average gross profit margin of this product reached 33%. Chest Electrical Impedance Tomography Device is a promising new medical functional imaging technology that non-invasively monitors lung ventilation and perfusion in real time by placing electrodes on the body surface. It is particularly suitable for intensive care settings that require continuous observation. The upstream sector is the technological source and innovation engine of the EIT industry, mainly focusing on core components, algorithms, and basic research. Electrodes and sensors are key components that directly contact the human body and collect signals. Flexible electrodes and high-performance biosensors represent the forefront of technology. Dedicated chips and electronic components are responsible for generating safe, weak excitation currents and processing the received weak voltage signals. These include high-precision analog front-end chips and signal processors, which are crucial to the signal-to-noise ratio and imaging quality of the instrument. Other hardware includes basic electronic components such as power modules and data acquisition boards required by the system. Software and algorithms are the "brain" of EIT technology. Due to the severe nonlinearity and ill-posedness of EIT problems, how to quickly and accurately reconstruct the impedance distribution image inside the human body from boundary voltage data is a core technological

barrier. Currently, artificial intelligence (AI) has been used to optimize algorithms, significantly improving imaging speed and clarity. The midstream sector is the link that integrates upstream technologies into the final product, namely, the manufacturers of EIT equipment. The downstream sector is where the value of EIT technology is ultimately realized, determining the direction of industry development. End users are mainly hospitals, especially intensive care units (ICUs), respiratory departments, and neurosurgery departments in tertiary hospitals. With the development of portable devices, their applications are gradually extending to community hospitals for chronic disease screening.

The global Chest Electrical Impedance Tomography Device market size was estimated at USD 492.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.50% during the forecast period.
