## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Chest Incision Retractor competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A thoracostomy retractor is a surgical instrument used to retract the sternum or ribs during thoracotomy to expose the internal structures of the thorax (such as the heart, lungs, and large blood vessels). It uses a mechanical device to firmly open the surgical incision, providing surgeons with a clear and stable surgical field of view. It is a key auxiliary tool in cardiothoracic surgery and is often used in complex operations such as thoracotomy heart surgery, lung resection, and aortic replacement. With the development of minimally invasive technology and intelligent surgery, thoracostomy retractors are evolving towards lightweight, ergonomic optimization, intelligent regulation, and compatibility with robot-assisted surgical systems. Future trends include: self-locking or electrically adjustable retraction structures, arc-shaped retraction designs that reduce tissue trauma, and intelligent retraction systems integrated with navigation systems and intraoperative imaging to improve surgical safety, efficiency, and patient recovery quality after surgery.

The global Chest Incision Retractor market size was estimated at USD 1674.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
